

# **Sovryn Token Bridge**

# Introduction

The bridge enables the transfer of ERC20 tokens across any two EVM-based chains.

It does so using the following components:

- arbitrary message bridge (AMB)
- AMB validators
- AMB live monitoring (ALM) app
- token bridge AMB extension
- token bridge dapp

# Arbitrary Message Bridge

The AMB is able to relay any data between two EVM-based chains.

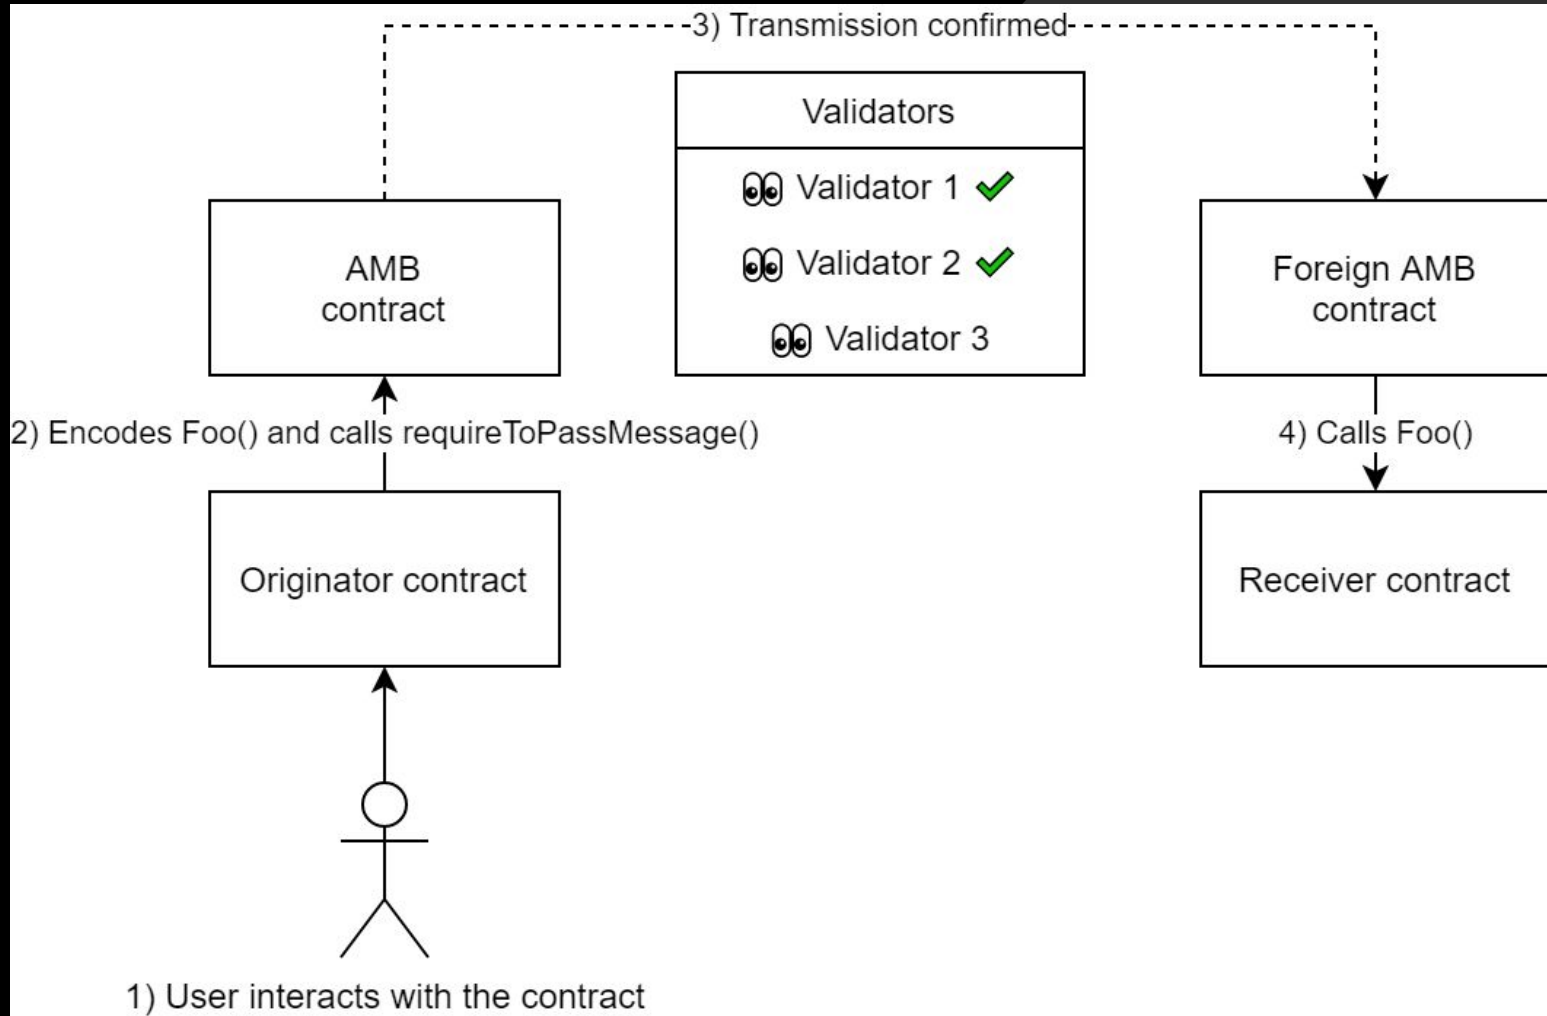

The originating contract encodes data in the form of an arbitrary method call, which can include or exclude parameters.

As soon as the data is relayed from Rinkeby to RSK Testnet by the AMB validators, the bridge contract on RSK Testnet passes the method call to the target contract.

# Calling a method cross-chain via AMB

```
function requireToPassMessage(address  
_contract, bytes _data, uint256 _gas) external;
```

- **\_contract**: address of the contract on the other network
- **\_data**: encoded bytes of the method selector and the parameters that will be called in the contract on the other network
- **\_gas**: gas to be provided in execution of the method call in the contract on the other network

# AMB Validators

- Provide 100% uptime to relay transactions
- Listen for **UserRequestForSignature** events on the Home side and sign an approval to relay messages on the Foreign side
- Listen for **CollectedSignatures** events on the Home side. Once enough signatures are collected, they transfer all collected signatures to the Foreign side.

# AMB Live Monitoring App

- Shows confirmations and the transaction status for each Arbitrary Message Bridge validator, and can monitor transactions in both directions
- Used to track the status of user requests sent through AMB mediators

The transaction [0x86eb...a9b5](#) was initiated about 3 hours ago

**Status:** Execution waiting

The specified transaction was included in a block  
and the validators collected signatures. Either

1. One of the validators is waiting for chain finalization.
2. A validator skipped its duty to relay signatures.
3. The execution transaction is still pending (e.g. due to the gas price spike).

Check status again after a few blocks or force execution by pressing  
the "Execute" button.

If the issue still persists contact the validators

Validator	Status	Age
0x16Da...B571	Success	<a href="#">about 3 hours ago</a>

1 of 1 confirmations required

Executed by	Status	Age	Actions
0x16Dac8c1342bf3213900F48E6899932d809BB571	Waiting	Searching Transaction...	<button>Execute</button> <input type="checkbox"/> Unsafe mode

# Token Bridge AMB Extension

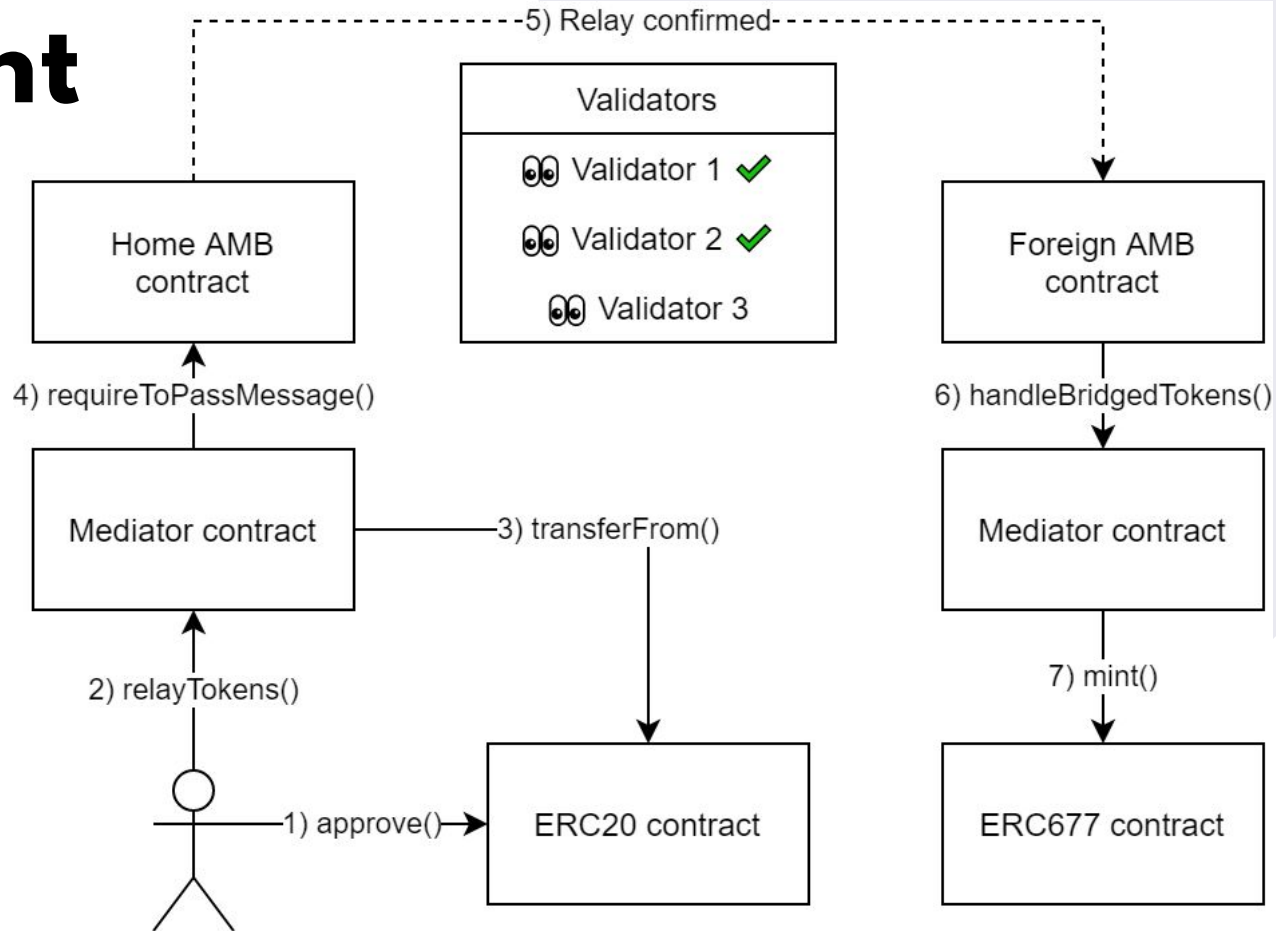

An AMB extension is a pair of mediator contracts associated with a specific pair of AMB contracts.

With this extension, any user can transfer tokens between Rinkeby and RSK Testnet without deploying any additional contracts. The specified token amount is locked in the mediator contract, a new token contract is deployed automatically on RSK Testnet, and the requested token amount is minted.

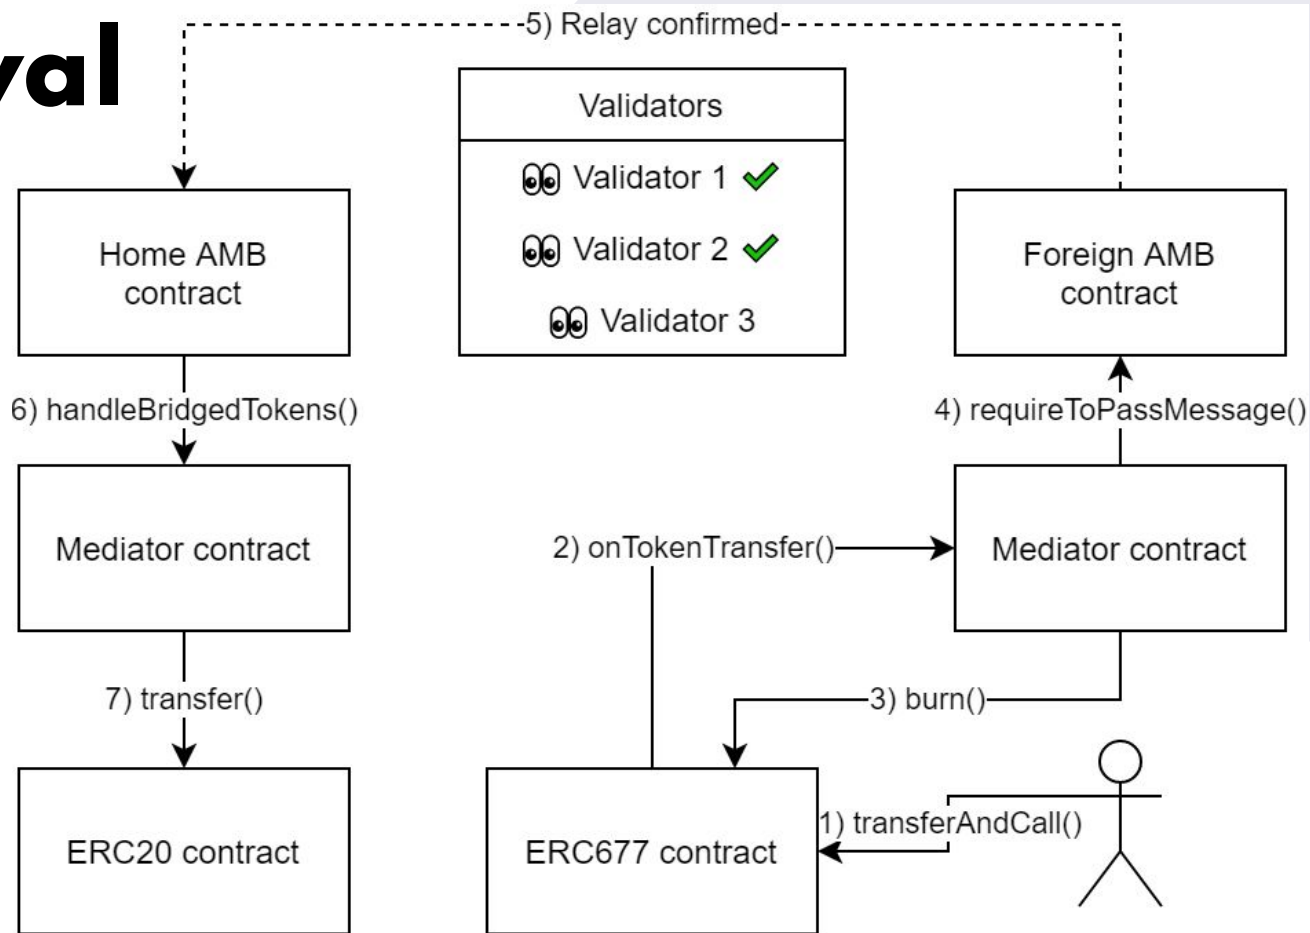

# First deposit through AMB

# Consequent deposits

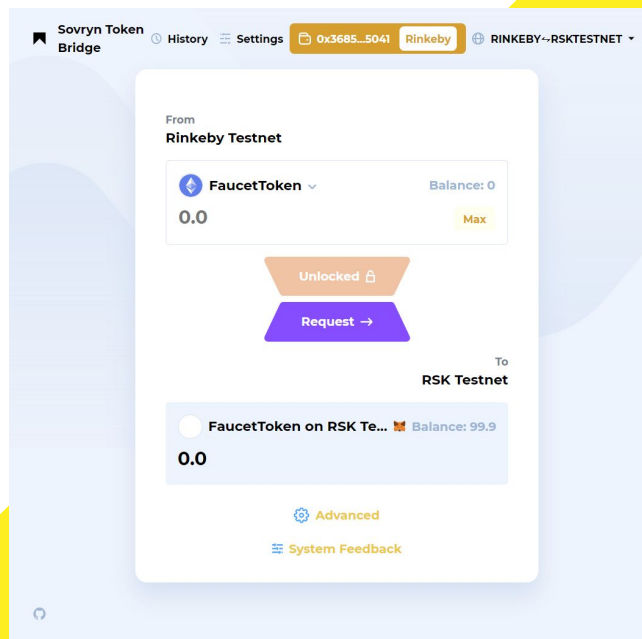

# Withdrawal

# Token Bridge Dapp

Makes it easier for users to utilize the Sovryn Token Bridge.
